Deleting VTADS Accounts

Kristi Hannett - 2019-09-09 - Older Knowledgebase Items

Deleting VTADS Accounts

When a user is terminated and they had access to VTADS, you will need to remove the user accounts in the servers they were in. To check if the user had an account in a VTADS server, log into the server then elevate to super user by typing **su** before entering the VTADS menu.

(For the password please see Kristi, Kathleen, or Jim B.)

Type **cd /etc** to switch to the correct directory for user accounts:

Then to search for the user accounts type **grep (the user's username) passwd:**

If the user does not have an account in that server, the next line will come up blank:

To delete the account, type **userdel (username)**:

There will be no output from VTADS, so search for the user as you did before to confirm they've been deleted. (grep *username* passwd)

If it comes up blank, the user has been deleted.

NEW 9/9/2019:

userdel command not working?? Add /usr/sbin/ before it:

/usr/sbin/userdel flast
